Given their roles in the
ecosystem, raptors are
widely considered the
flagship or umbrella
species among birds.
Most species
undertake a seasonal
journey that is
impressive because of
the length, and the
imposing natural

barriers such as
deserts and seas that
they fly over. The
migration of birds of
prey has unique
characteristics in the
animal world because
of their morphology
and flight style. The
flying path of Afro-
Palaearctic migrants
between breeding and
wintering grounds is
determined by several
factors such as
morphology of the
birds, geography,
behavioural
adaptations. The book
analyses the migration
patterns of raptors
along the Afro-
Palaearctic migratory
system, and
summarizes the recent
research on these top
predator species.
Behavioural
adaptations such as
the importance of
social interactions and
the modulation of the

different flight styles as well as ecological interactions with the encountered environment and weather conditions en route are described in the book. Moreover, the impact of climate change on the migratory behaviour and key conservation issues are discussed. The book provides an overview of the migratory characteristics and flyway patterns of all European raptor species and also some Asian ones. These chapters have been written by some of the most important raptor specialists, giving a complete picture of the different migration strategies on the basis of both traditional methods and new technologies.

Lombardia IUCN

This publication is a compilation of current knowledge of the numbers, distribution and movements of one of the most remarkable groups of birds in the region covered by the African-Eurasian Migratory Waterbird Agreement (AEWA). Long-term waterbird count data have been combined with an extensive literature review, especially published results of bird ringing and national bird atlases, to produce maps showing the population boundaries that are used as a basis of the conservation of these species. The maps are

supported by informative species accounts that highlight the movements, population status and conservation of waders in the AEWA region.

Recent genetic data showing that Neanderthals interbred with modern humans have made it clear that deeper insight into the behavioral differences between these populations will be critical to understanding the rapid spread of modern humans and the demise of the Neanderthals. This volume, which brings together scholars who have worked with faunal assemblages from Europe, the Near

East, and Africa, makes an important contribution to our broader understanding of Neanderthal extinction and modern human origins through its focus on variability in human hunting behavior between 70-25,000 years ago—a critical period in the later evolution of our species.

Atlante degli uccelli di Piemonte e Valle d'Aosta in inverno (1986-1992) Atlante della migrazione degli uccelli in Italia Atlante della migrazione degli uccelli in Italia. 1. Non-Passeriformi Atlante della migrazione degli uccelli in Italia Zooarchaeology and Modern Human Origins Human Hunting Behavior during the Later Pleistocene A common sight around the more

northerly shores of the British Isles, the Common Eider is the largest duck in the northern hemisphere. The eider is particularly well adapted to cold-water environments; the insulating properties of eider down are iconic. The species is taxonomically interesting, with a range of well-marked subspecies reflecting the patterns of ice coverage during ancient glaciations, and these ducks have also provided the focus for a number of important behavioural studies, especially on feeding ecology and energy budgets. Eiders have a long association with humans, and have deep cultural significance in many societies. However, modern lifestyles are

exposing these ducks to a wide range of new pressures. This monograph provides a comprehensive portrait of the Common Eider; authors Chris Waltho and John Coulson bring together an extensive and diverse international literature, with sections on taxonomy, habitats, breeding biology, population dynamics, diet and foraging, dispersal and migration, and conservation.
