(BCNF) Application of the general definitions of 2NF and 3NF may identify additional redundancy caused by dependencies that violate one or more candidate keys. However, despite these additional constraints, dependencies can still exist that will cause redundancy to be present in 3NF relations. Boyce-Codd Normal Form (BCNF) - GeeksforGeeks Boyce-Codd Normal Form (BCNF) is one of the forms of database normalization. A database table is in BCNF if and only if there are no non-trivial functional dependencies of attributes on anything other than a superset of a candidate key.

BCNF is also sometimes referred to as 3.5NF, or 3.5 Normal Form. What is Boyce-Codd Normal Form (BCNF)? - Definition from ... Boyce-Codd Normal Form (BCNF) BCNF is an extension to Third Normal Form (3NF) and is slightly stronger than 3NF. A relation R is in BCNF, if $P \rightarrow Q$ is a trivial functional dependency and P is a superkey for R. Boyce-Codd Normal Form (BCNF) - tutorialspoint.com Boyce Codd normal form (BCNF) BCNF is the advance version of 3NF. It is stricter than 3NF. A table is in BCNF if every functional dependency $X \rightarrow Y$, X is the super key of the table. For BCNF, the table should be in 3NF, and for every FD, LHS is super key. Example: Let's assume there is a

company where employees work in more than one department. Boyce Codd normal form (BCNF) - javatpoint.com Boyce-Codd normal form (or BCNF or 3.5NF) is a normal form used in database normalization.
