Digital signal processing lies at the heart of the communications revolution and is an essential element of key technologies such as mobile phones and the Internet. This book covers all the major topics in digital signal processing (DSP) design and analysis, supported by MatLab examples and other modelling techniques. The authors explain clearly and concisely why and how to use digital signal processing systems; how to approximate a desired transfer function characteristic using polynomials and ratio of polynomials; why an appropriate mapping of a transfer function on to a suitable structure is important for practical applications; and how to analyse, represent and explore the trade-off between time and frequency representation of signals. An ideal textbook for students, it will also be a useful reference for engineers working on the development of signal processing systems.

This book consists of two analytic papers. The first chapter of this book entitled "System Analysis, Design and Construction" reviews studies conducted on information system. As a case study it evaluates a system for schools and departments which assesses students through a number of assessment components. It demonstrates a practical design in decision-making at the Pass/Fail boundary, the mathematical fundamentals in the application of these policies and inherent in marks. It also proposes processes involved in error-estimation by the raters. The second chapter of the book entitled "Easy Reading Online Bookstore System" discusses development of an online bookstore, which includes various necessary components including shopping mechanism, purchasing statistics, and management tools. The paper concentrates on the design of the data base and its integration with the implemented system.
