Communications-based train control (CBTC) Cbtc Communications Based Train ControlThe CITYFLO 450 solution is a communication-based train control (CBTC) virtual block system designed for metros with drivers. The system is used for virtual block semi-automatic running of trains (STO) on segregated tracks and has the potential for upgrading to a driverless system. Communications-based train control (CBTC) Communications-based train control (CBTC) is a railway signaling system that makes use of the telecommunications between the train and track equipment for the traffic management and infrastructure control. By means of the CBTC systems, the exact position of a train is known more accurately than with the traditional signaling systems. Communications-based train control - WikipediaThe IRT Flushing Line, and the trains used on the 7 and <7> services, do not have ATS for two reasons: they are isolated from the main-line A Division, and they were already planned to get communications-based train control (CBTC) before the ATS on the A Division, or ATS-A project, had started. ATS allows dispatchers in the Operations Control ... Signaling of the New York City Subway -

WikipediaCommunication-based train control, or CBTC, relies on a moving-block system. Equipment on trains and tracks tells us exactly where a train is, so we can operate trains more closely together. Benefits of CBTC. More efficient service. Because we know exactly where trains are on the track, we can run them closer together. CBTC: Upgrading signal technology for faster, more ...
