Dress Pattern Designing Fairchild Books

After reading this book, you won't just be able to follow pattern making instructions - you will actually understand how and why pattern making works and be able to adapt the principles for yourself. The perfect introduction to the core principles of garment construction, "How Patterns Work" simplifies and explains the relationship between pattern making and the body. Instead of learning hundreds of separate pattern making processes, "How Patterns Work" will break the process into simple principles that can be applied to any pattern change.

"How Patterns Work" has been designed with: Over 70,000 words of text content. Over 250 diagrams in crisp black, white and grey. A clear table of contents for easy reference. No previous knowledge of patterns or sewing required. Chapters start from zero assumed knowledge and build slowly in complexity with step by step examples and clear diagrams. The first section of the book will answer questions such as: What are darts and how do they work with the curves of the body? What is seam allowance and how much should you add to your pattern? How are body measurements used to create accurate patterns? What are blocks and how are they different to patterns? What do the basic blocks look like? This first section of the book will also explain the overall anatomy of a pattern including the definition and uses of notches, drill holes, grain lines and body guidelines. All of the examples are shown in relation to how the pattern will ultimately be sewn, so that the principles become more relevant to real sewn garments. A large section of the book is devoted to pattern examples that can be used as a reference library to adapt and change to suit your own pattern making needs. The examples that are covered in this first section include: Adding a seam line. Removing a seam line. Moving the position of a dart. Turning

darts into seam lines. Turning seam lines into darts. Increase volume evenly. Decrease volume evenly. Increase volume around a point. Decrease volume around a point. Using darts to increase volume. All of the examples listed above are shown using both the cut and spread, and the pivot flat pattern making methods, and then also shown as a draped section of fabric on a mannequin, allowing you to really see the pattern changes as both a flat pattern, and in a more tangible 3D form. Whether you are a novice fashion student, or an experienced home sewer this is the perfect book to simplify the terminology and principles behind complex pattern making books and sewing courses. Designed as a companion guide to other pattern making texts, "How Patterns Work" consolidates pattern making methods into simple, memorable processes - making this book a perfect refresher guide for even the most advanced pattern maker. Please note that this book does not include paper patterns and does not cover specific pattern drafting exercises. Instead, this book will provide you with an overview to simplify the way you think about pattern making, arming you with knowledge that can be applied to any pattern change.

Foundations of Flat Patterning and Draping: For the Female Form provides the foundational tools necessary for success in the techniques of flat patterning and draping clothes and costumes. This book begins with the basics of taking measurements, preparing the fabric for draping, and preparing the dress form. The following chapters explore flat patterning and draping practices for bodices, skirts, pants, dresses, sleeves, collars, cuffs, and facings through detailed step-by-step instructions, checklists, and numerous diagrams. The bodice drafting instructions in this book, specifically, are a new method that accommodates all bust and cup sizes. There are instructions for small and large cup sizes allowing for a fit that does not gap at the armhole as typically happens with previous patterning methods, and additional sections for bodices and sleeves and how to manipulate them to create alternate looks. The techniques in this book generalize across sizes and shapes making it universally applicable for the student technician, as well as the person the garment is being developed for. Each method of drafting and draping has been class-tested and proven to produce well-fitting garments. Presented in an accessible format with clear instructions and detailed illustrations, this book is well suited for use as a textbook for the undergraduate college instructor teaching costuming or fashion, as well as for the student or individual learning on their own in theatre, film, or fashion industries.

Pattern making describes the process of creating a two-dimensional garment diagram or template, drafted on a flat surface from either measurements or transferred from a draped muslin. The starting point of a pattern is a sloper, which is used as the template for creating design variations that are subsequently cut and sewn in fabric. You will learn how to create a basic sleeve sloper before moving on to skirts, bodices, collars and pants. Each lesson is illustrated in meticulous detail by step-by-step photographs, charts, diagrams and catwalk photos.

How Patterns Work Houghton Mifflin School

Fashion designers are presented with a range of methods and

concepts for pattern cutting are presented, the main body of these methods, both traditional and contemporary, is predominately based on a theoretical approximation of the body that is derived from horizontal and vertical measurements of the body in an upright position: the tailoring matrix. As a consequence, there is a lack of interactive and dynamic qualities in methods connected to this paradigm of garment construction, from both expressional and functional perspectives. This work proposes and explores an alternative paradigm for pattern cutting that includes a new theoretical approximation of the body as well as a more kinetic method for garment construction that, unlike the prevalent theory and its related methods, takes as its point of origin the interaction between the anisotropic fabric and the biomechanical structure of the body. As such, the research conducted here is basic research, aiming to identify fundamental principles for garment construction. Based on some key principles found in the works of Geneviève Sevin-Doering and in pre-tailoring methods for constructing garments, the proposed theory for – and method of – garment construction was developed through concrete experiments by cutting and draping fabrics on live models. Instead of a static matrix of a non-moving body, the result is a kinetic construction theory of the body that is comprised of balance directions and key biomechanical points, along with an alternative draping method for dressmaking. This methodology challenges the fundamental relationship between dress, garment construction, and the body, working from the body outward, as opposed to the methods that are based on the prevalent paradigm of the tailoring matrix, which work from the outside toward the body. This alternative theory for understanding the body and the proposed method of working allows for diverse expressions and enhanced functional possibilities in dress.
