 This book is designed to be an inclusive for the best practice approach to building maintenance management, where the processes, procedures and operational systems meet a high standard of professional and academic competence. It offers a different perspective on building maintenance management by presenting the schematic building maintenance value chain model and its implementation in Malaysian university buildings. The findings show an improvement to building performance, lower maintenance cost, building sustainability and increased maintenance service user satisfaction. The learning outcomes and summaries provided for each chapter and the extensive use of tables and figures add to the readability of the text. Though the book is based on data from Malaysia, it is useful for a much wider audience, and the informal writing style makes it an interesting reference source. This book is valuable for readers who are practitioners, professionals and for academic institutions that offer courses in the building field, including

architecture, quantity surveying, civil engineering, building and facility management, property management, real estate. It will also be of interest to governments and others involved in the construction industry.

Quantity Surveying Practice: The Nuts and Bolts is a practical guide to quantity surveying in building construction. Due to the increasing expectations of quality and performance from project clients, quantity surveyors must improve their professional skills to solve a variety of intricate problems and disputes confronting the demanding construction market. This practical book focuses on the basic concepts underlying the technical aspects of quantity surveying and contains many worked examples together with useful figures and real-life cases to help readers digest and understand the essentials and become better professionals as a result. This book is organised and structured into seven chapters. Chapter 1 is about the estimation of construction costs. Chapter 2 gives an overview of tendering and tender documentation. Chapter 3 examines the procedure of tender examination and the approach to contract award. Chapter 4 reviews the whole process of an interim valuation from the submission of a payment application by the contractor to the issuance of an interim valuation by the quantity surveyor, identifying the key issues within the process. Chapter 5 examines the topic of construction claims. Chapter 6 addresses the cost control and monitoring in connection with construction projects. Chapter 7 is about dispute management and three commonly used dispute resolution mechanisms, namely mediation, adjudication and arbitration are introduced. This book is essential reading for students on quantity surveying and construction management programmes, as well as the APC candidates pursuing the professional quantity surveying pathway. The past decade has seen dramatic changes in the construction industry and the quantity surveying profession. The Latham and Egan reports and a client-led crusade for value for money is driving Quantity Surveyors to adopt these changes. In addition, the industry and the profession now stands on the threshold of the e-commerce revolution - one which has so far failed to penetrate the working practices of the majority of surveyors, particularly SMEs. Duncan Cartledge addresses the evolving market in which today's Quantity Surveyors work, examining the new construction culture, new procurement strategies, e-practice and the QS, changing markets, delivering added value, supply chain management and partnering. The book is recommended reading for students of quantity surveying and an essential guide for all surveying professionals seeking to familiarise themselves with the latest developments.

It deals in a practical and reasonable way with many of the estimating problems which can arise where building and civil engineering works are carried out and to include comprehensive estimating data within the guidelines of good practice. The early part of the book has been completely rewritten to contain chapters useful to students and practitioners alike for the development of the estimating process resulting in the presentation of a tender for construction works. The second and major part of the book contains estimating data fully updated for the major elements in building and civil engineering work, including a new chapter on piling, and a wealth of constants for practical use in estimating. The estimating examples are based on the current edition

of the Standard Method of Measurement for Building Works (SMM7). The comprehensive information on basic principles of estimating found in 'Spence Geddes' are still as valid today as the first edition. In this edition the prevailing rates of labour and costs of materials are taken whenever possible as a round figure. Readers will appreciate in the construction industry that prices are continually changing, rise and fall, and that worked examples should therefore be used as a guide to method of calculation substituting in any specific case the current rates applicable to it. In the case of plant output dramatic increases have been experienced in productivity over recent years and again estimators with their own records should substitute values appropriate to their work.
