 Actuarial theory and the mathematical theory of risk are practically identical. There are, of course, many aspects of actuarial science and actuarial practice that are effectively independent of risk theory. Yet if one attempts to define the singular body of theory on which actuarial science is based, BOOK NOTES - Hans Bühlmann, 'Mathematical Methods in Risk ...
 Mathematical Methods in Risk Theory. Nonetheless, a new orientation of actuarial mathematics has taken place in the past few decades which has introduced fundamental new accents. The stimulus for this development arose from areas of activity other than life insurance, viz. from casualty insurance or from the non-life branches of insurance generally.  With the dissemination of quantitative methods in the financial sector and advent of complex derivative products, mathematical models have come to play an increasingly important role in financial decision making, especially in the context of pricing, hedging and risk management of derivative instruments. Mathematical Methods for Valuation and Risk Assessment of ... Hence, the risk measured in VaR for shares of a portfolio is at times the risk of one share of this portfolio. Moreover, adding ($b < 0$) or withdrawing ($b > 0$) an amount $|b|$ of money from the portfolio changes this risk by the same amount. Example 3.4 Suppose the loss distribution is normal, $L \sim N(\mu, \sigma^2)$.

 Mathematical Methods in Risk Theory, By Hans Bühlmann ... In these notes we will, as far as possible, use these probabilistic methods. 1. 2 Stochastic models for the total amount of loss during a fixed period. In risk theory there are two basic models for the amount of loss in an insurance collective: the individual model and the collective model. RISK THEORY - arXiv
