PracticalWe have studied
how an AC mains voltage
applied to the primary
winding of a transformer
is magnetically induced to
its secondary winding. In
this article we will learn

how to design an autotransformer through simple manipulations of ordinary transformers and get them converted into auto transformers. Consequently auto-transformer can be design with less active material (i.e. copper and steel) in comparison with a standard two-winding power transformer design for same rated voltages and rated through power. It can be shown that this reduction factor can be calculated for the example auto-transformer

by using the following equation: Differential Protection Schemes for Auto- Transformers If it's running from an oscillator then the frequency is fixed therefore you can tune the auto-transformer so that there is minimal reactive load to the oscillator. A 33pF capacitor and a 1uH coil are resonant at about 28MHz but do some tweaking so that the unloaded inductor and capacitor are near enough fully resonant at 28 MHz. transformer - Autotransformer design --
