The objectives of this research are to design and develop a visual tracking system for lower limb range of motion assessment; to test the performance of visual tracking system and compare it

with Universal Goniometer and Electrogoniometer for measuring the range of motion for lower limb joint; to assist the doctor for classifying the range of motion of patient between normal and abnormal (severity level: mild, moderate, and severe) based on lower limb joints flexion motion; to analyse and document on the range of motion for lower limb joint surgical recovery process during pre-operation,

post-operation and during rehabilitation.
Measurement of Joint Motion Lippincott

This new resource is a comprehensive view of the clinical evaluation and functional application of joint range of motion. Coverage includes discussions of different types of goniometers, alternate methods of assessment, the reliability and validity of other joint ROM tools, and contraindications and precautions. This book also provides a complete review of surface anatomy and instruction on palpation technique and therapist posture and positioning when evaluating ROM. Numerous illustrations depict the therapist's hand and goniometer positions in relation to deep anatomical structures. Case studies and practical examination forms are also included.
